

Q Search

OVERVIEW

Initial emissions standards for off-road engines (found in mining, construction, farming, etc) in Canada were aligned with US EPA standards. However, there are separate standards and timelines for different engine types; while off-road compression-ignition engines align with US Tier 4, off-road small spark-ignition engines (which include handheld machines) operate under a their own standard. Underground mining equipment engines fall under provincial jurisdiction, and marine engines align with correspond current US EPA regulations.

HISTORY

Prior to the Canadian Environmental Protection Act 1999 (CEPA 1999), there was no federal authority for regulating emissions from off-road engines such as those typically found in construction, mining, farming and forestry machines. Under the December 2000 Ozone Annex to the 1991 Canada-United States Air Quality Agreement, Canada committed to establishing emission regulations under CEPA 1999 for new off-road engines that aligned with the US EPA requirements. In the period before

Off-Road Compression-Ignition Engine Emission Regulations

The Off-Road Compression-Ignition Engine Emission Regulations were promulgated on 23 February 2005. These regulations introduced emission standards for model year 2006 and later diesel engines used in off-road applications such as those typically found in construction, mining, farming and forestry machines. These regulation encompassed the US EPA Tier 2 and Tier 3 standards. In November 2011, the regulations were amended to align with the US EPA Tier 4 standards.

Off-Road Small Spark-Ignition Engine Emission Regulations

The Off-Road Small Spark-Ignition Engine Emission Regulations were promulgated on 19 November 2003. The Regulations apply to off-road engines of model year 2005 and later that use sparkplugs and develop no more than 19 kW (25 hp) of power. Typical small spark-ignition engines are gasoline-fuel and are used in lawn and garden machines, in light-duty industrial machines, and in light-duty logging machines.

Off-Road Large Spark-Ignition Engine Emission Regulations

Environment Canada plans to propose regulations to address emissions from large spark-ignition engines used in industrial applications such as forklifts and ice re-surfacing machines in the future.

Canadian Tier 2/3 Off-Road Compression-Ignition Engine Emission Standards, g/kWh

Tier 4 Standards

On 17 November 2011, Environment Canada adopted amendments to the Off-Road Compression-Ignition Engine Emission Regulations which align Canadian emission standards with the US Tier 4 standards for nonroad engines. The Tier 4 standards came into force on 16 January 2012 and apply to engines of the 2012 and later model years manufactured on and after 16 January 2012.

Applicability

The Off-Road Compression-Ignition Engine Emission Regulations apply to "reciprocating, internal combustion engines, other than those that operate under characteristics significantly similar to the theoretical Otto combustion cycle and that use a spark plug or other sparking device." This definition is not exactly the same as the definition of a diesel engine used in the On-Road Vehicle and Engine Emission Regulations where a diesel engine is defined as one "that has operating characteristics significantly similar to those of the theoretical Diesel combustion cycle. The non-use of

The regulations specifically exempt engines:

- · designed exclusively for competition
- regulated by the On-Road Vehicle and Engine Emission Regulations;
- designed to be used exclusively in underground mines;
- with a per-cylinder displacement of less than 50 cm³;
- for military machines used in combat or combat support;
- being exported and not sold or used in Canada;
- designed to be used in a vessel and for which the fuel, cooling and exhaust systems are integral parts of the vessel.

While not specifically exempted by the regulation, Environment Canada does not have legislative authority to regulate emissions from railway locomotive engines.

The Canadian Off-Road Compression-Ignition Engine Emission Regulations do not include an optional averaging, banking and trading program as in the US EPA regulations.

Mining Engines

Emissions from engines used exclusively in underground mining equipment fall under provincial jurisdiction. While emissions from these engines are not directly regulated, provincial regulations exist for ventilation rates in mines where these engines are used. Canadian Standards Association (CSA) standards have been established that describe the technical requirements and procedures necessary for the design, performance, and testing of new or unused non-rail-bound, dieselpowered, self-propelled machines in underground mines (MMSL02-043). Testing carried out according to these CSA standards establish the minimum ventilation rate required for any engine to keep air quality at an acceptable level. Some provinces base their ventilation requirements on the results of testing according to the CSA standards.

			2007	72	_	603

Notes:

a – Standards apply only when the engine is new

b – Some engine classes include a combined NMHC+NOx standard that applies only when the engine is fueled by natural gas

1 – For models already in production at coming into force of the Regulations

2 – For models initially produced after coming into force of the Regulations

Engines must meet the emission standards throughout their useful life (with the exception of pre-2005 Class I engines, as indicated in the table). At the time of engine certification, a manufacturer can select one of three specified useful life periods, which range from 50 to 1000 hours depending on the engine class. For example, for a class I engine, the useful life can be 125, 250 or 500 hours. The selection of useful life duration must be supported by technical information. Longer useful lives, which entail a higher manufacturing cost, are typically found in commercial equipment while home consumer products are often designed for shorter useful lives.

Alternative less stringent emission standards, consistent with those

subject to the applicable CO standard.

- for replacement engines which are engines manufactured exclusively to replace an existing engine in a machine for which no current model year engine with physical or performance characteristics necessary for the operation of the machine exists;
- for class III, IV and V when less than 2000 engines of a particular model are sold in total in Canada to accommodate Canada-only niche products.

MARINE SPARK-IGNITION ENGINE, VESSEL AND OFF-ROAD RECREATIONAL VEHICLE EMISSION REGULATIONS

On 4 February 2011, Environment Canada adopted Marine Spark-Ignition Engine, Vessel and Off-Road Recreational Vehicle Emission Regulations. These emission regulations apply to outboard engines, personal watercraft, snowmobiles, off-highway motorcycles and all-terrain vehicles. Most of the regulatory provisions came into force from April 5, 2011. The standards align with corresponding US EPA rules for marine spark-ignition engines and off-road recreational engines and vehicles. An earlier MOU with the Canadian Marine Manufacturers Association covered only marine spark ignition engines and under its terms, engine manufacturers voluntarily committed to supply engines designed to meet United States federal emissions standards into Canada starting with the 2001 model year.
